# Software Architecture and Techniques 

## What is Agile Architecture?

## Observations

Every software developer is also a designer, every software developer is also an architect.

1) The sum of all the source code is the true design blueprint or software architecture.
2) The real software architecture evolves (better or worse) every day of the product, as people do programming.
3) The real living architecture needs to be grown every day through acts of programming by master programmers.
4) A software architect who is not in touch with the evolving source code of the product is out of touch with reality.
5) Every programmer is some kind of architect -whether wanted or not. Every act of programming is some kind of architectural act - good or bad, small or large, intended or not -

## Agile Architecture Principles (SAFe)

1) Design emerges. Architecture is a collaboration.
2) The bigger the system, the longer the runway.
3) Build the simplest architecture that can possibly work.
4) When in doubt, code or model it out.
5) They build it. They test it, They run it.
6) There is no monopoly on innovation.
7) Implement architectural flow.

$$
\square n^{\infty}
$$

can decision be deferred? how? partly?

- persist data of your system to survive restart
- how to translate UI and data
design to be independent on decision
- communication between parts of your system
- scaling (run on multiple threads, processes, machines)
- security (how to authenticate, authorize)
- journaling (Activities, data)
- reporting
- data migration / data import
- teleasability
- backwards compatibility
- response times
- Archiving data

define evolution steps

Sirius Cybernetics $\quad 11 \mathrm{O} \cap$
Druid Resources Department (DRD)
Step I manage data of all druids
assembly date

- retirement date
- serial number
- jobs
- work place
- from/to date
- customer feedback

Step II journaling

On $^{(1)}$ communicate use effective tools
MOM Be part of the team
$\cdots \stackrel{r}{\text { learn to be a good designer }}$
! make sure decisions are made
what do you do as an architect?
compare with Agile Architect cheelelist

Questions: (by Michael Nygard)

- who is the consumer?
- what do they need?
- how do you deliver it to them?
- how do you know when they are ready for it?
- how do you produce it?
- what input do you need to produce it? not what you want to do
shared
whole team participates

## Exercises

- Read cheat sheet "Agile Architecture"
- Apply the learnt principles to your actual product
- Improve one Java class following clean code
- Build it through your CI/CD pipeline

```
Define actions to make your
Architecture more agile
```
